

ASSEMBLY INSTRUCTIONS

Screw Tightening Instructions

During assembly, insert all screws into their holes and tighten them to approximately 70% – 80% only. Do not fully tighten the screws at this stage. Once all screws have been installed and all parts are properly aligned, fully tighten all screws.

If you encounter any issues during assembly, such as misaligned holes or difficulty installing certain parts, please make sure you are using the correct screws and adjust the screw tightness as needed until all parts fit properly.
